

A GUIDE TO INSTALL MALWARE ON MY FRIENDS PC

BUILD AND AUTHORED
BY TEAM **GDGC**

~ Dedicated to my friend Shekhar

INSTALLATION & SETUP

For the installation instructions, setup process, required files, and project preparation, refer to the GitHub repository:

Malware Manual — GitHub Repository

<https://github.com/samiksha2644/malware-manual>

DISCLAIMER: All projects in this collection are created strictly for entertainment, educational, and simulation purposes. They should be treated as harmless demonstrations and must not be used to damage, interfere with, or access someone else's computer or data without permission.

1. Auditory Hazard & Volume Warning

Some simulations may contain sudden sounds, loud audio, or repeated audio effects. Test with the volume kept low and avoid headphones or earbuds if the program contains unexpected loud audio. Stop the program immediately if the sound is uncomfortable.

2. Photosensitivity & Visual Effects Warning

Some simulations may use flashing, rapidly changing colors, glitch effects, or other intense visual transitions. People who are sensitive to flashing lights should avoid these effects. Consider testing the program before sharing it.

3. Data Protection & Hardware Safety

Save your work before running any simulation and close important applications.

Do not deliberately force a computer to shut down because of a prank. A sudden power loss can cause unsaved-data loss or filesystem problems.

Use a clearly provided exit/stop control whenever possible and test the program yourself before sharing it.

4. Ethical Use & Explicit Consent

- 1. Never install or execute a prank on another person's computer without their knowledge and permission.*
- 2. Only use these projects on your own devices, test machines, or systems where you have explicit authorization.*
- 3. Do not distribute a program that locks a screen, changes system behavior, or produces distressing effects to someone who has not agreed to receive it.*
- 4. Consider your audience. A realistic computer warning can cause unnecessary stress or confusion.*

5. Security & Antivirus Notice

Newly compiled or unsigned executables may sometimes trigger Windows Defender or other security software. Do not tell users to disable security protections just to run a prank. If a security product identifies behavior you did not expect, stop and inspect the source code before continuing.

6. What These Pranks Should Not Do

- *Delete, corrupt, or encrypt files*
 - *Steal or collect personal information*
 - *Upload data without permission*
 - *Create hidden persistence or backdoors*
 - *Disable security software*
 - *Modify important Windows system files*
 - *Prevent the owner from regaining control of their computer*
-

MALWARE MANUAL

The Totally-Not-Suspicious Prank Collection™

Welcome to the Malware Manual — a collection of little programs designed to make your friends go:

“BRO WHAT DID YOU JUST DO TO MY PC?!”

These are prank simulations, not actual malware. Pick your level, grab a friend who is actually up for a prank, and let the chaos begin.

1 LEVEL 1 — IDIOT VIRUS

The classic. The stupidest. The most annoying. 🧠

This one is basically a never-ending conversation with one question:

“Are you an idiot?”

If your friend keeps choosing No, the question keeps coming back.

And coming back.

And coming back.

Yep. That's the entire prank. 😂

🐱 How to use it

This one is perfect when you want something super simple and ridiculous.

Once you've got the **.exe** ready, give it to your friend as part of a prank they've agreed to participate in and let them discover what happens.

💡 Friend tip

Don't explain what's inside beforehand.

Just casually say:

“Bro, open this for a second.”

Then sit back and enjoy the world's least complicated psychological experiment. 🧠

🧠 Source Code

Dim var

Do

```
var = MsgBox("Are you an idiot?", 4 + 16, "PC Hacked")
```

If var = 6 Then

```
MsgBox "Hahah, I Knew It!", 0 + 64, "PC Hacked"
```

```
Set ws = CreateObject("WScript.Shell")
```

```
ws.Run "shutdown /s /t 0", 0, False
```

Exit Do

End If

Loop

📦 Getting the EXE

Follow the installation/build setup in the GitHub repository below to prepare the project for your demonstration.

2 LEVEL 2 — MINECRAFT SYSTEM SIMULATION

For the Minecraft gamer. 🎮💀

Okay, this one is way more believable-looking.

If your friend is the type of person who sees the word Minecraft and immediately clicks, this is probably going to get their attention. 😂

The screen starts looking like some extremely serious system diagnostic has gone horribly wrong.

Fake warnings.

Fake system messages.

Fake “uh-oh” moments.

Basically: Minecraft.exe has entered its villain era.

How to use it

Prepare the `.exe` using the setup instructions and use it as part of a prank with a friend who has agreed to participate.

Then you can go with something innocent like:

“I made a little Minecraft system diagnostic thing. Try opening it.”

And let the screen do the rest.

Friend tip

This one works especially well if your friend is already interested in Minecraft or computers.

Just don't start screaming “YOUR PC IS HACKED!!!” immediately.

Let them look at the screen first.

The more confused they are, the funnier the reaction. 

Getting the EXE

Follow the installation and setup instructions in the GitHub repository, then use the prepared `.exe` for your demonstration.

LEVEL 3 — PYRUS MASTER

Okay... NOW we're getting dramatic. 

This is the big one.

You've got glitch effects.

You've got the scary crash-screen look.

You've got the whole “WHY IS WINDOWS DYING?” experience.

This one is much better suited to a lab computer or controlled demo machine rather than casually sending it around.

How to use it

Run it on your LAB COMPUTER / TEST COMPUTER and let the simulation play.

The goal is to make the screen look like something has gone seriously wrong.

For maximum dramatic effect:

- Sit there completely normally.

- Let the screen start glitching.

- Say absolutely nothing.

- Wait for the reaction. 🧟

Friend tip

If you're demonstrating it to someone, don't immediately explain what's happening.

Let them stare at the screen for a few seconds.

Then hit them with:

“Relax. It's a simulation.” 😂

📦 Getting the EXE

Follow the installation and setup instructions in the GitHub repository to prepare the project for your lab demonstration.

🔗 INSTALLATION & SETUP

For the installation instructions, setup process, required files, and project preparation, refer to the GitHub repository:

Malware Manual — GitHub Repository

<https://github.com/samiksha2644/malware-manual>

🎮 FINAL WORD

Three levels.

Three different kinds of chaos.

Level 1:

“Are you an idiot?”

Level 2:

“Bro... why does Minecraft look like it's hacking my PC?”

Level 3:

“WHY IS WINDOWS DYING?!”

Have fun, prank responsibly, and remember:

The best prank is the one where everyone laughs at the end. 😂💀

DISCLAIMER

This manual and its accompanying projects are provided for educational, demonstration, and entertainment purposes only.

The creators do not encourage unauthorized access, data destruction, credential theft, malware deployment, or any other harmful activity.

Always use these simulations responsibly, obtain appropriate permission, and respect the privacy and security of others.

Stay Safe. Stay Ethical. Have Fun Responsibly.
